Sec 1

Directions for questions 1 to 4: The passage below is accompanied by four questions. Based on the passage, choose the best answer for each question.

[There] are future and emerging technologies that may have. . .a profound impact. Consider, for example, brain-computer interfaces. In case computers are connected directly to the brain, not only are behavioural characteristics subject to privacy considerations, but even one's thoughts run the risk of becoming public, with decisions of others being based upon them. In addition, it could become possible to change one's behaviour by means of such technology. Such developments, therefore, require further consideration of the reasons for protecting privacy. In particular, when brain processes could be influenced from the outside, autonomy would be a value to reconsider to ensure adequate protection.

Apart from evaluating information technology against current moral norms, one also needs to consider the possibility that technological changes influence the norms themselves. Technology thus does not only influence privacy by changing the accessibility of information, but also by changing the privacy norms themselves. . . . With future and emerging technologies, such influences can also be expected, and therefore, they ought to be taken into account when trying to mitigate effects.

Another fundamental question is whether, given the future (and even current) level of informational connectivity, it is feasible to protect privacy by trying to hide information from parties who may use it in undesirable ways. Gutwirth & De Hert argue that it may be more feasible to protect privacy by transparency – by requiring actors to justify decisions made about individuals, thus insisting that decisions are not based on illegitimate information. This approach comes with its own problems, as it might be hard to prove that the wrong information was used for a decision. Still, it may well happen that citizens, in turn, start data collection on those who collect data about them, e.g. governments. Such "counter(sur)veillance" may be used to gather information about the use of information, thereby improving accountability. The open-source movement may also contribute to the transparency of data processing. In this context, transparency can be seen as a pro-ethical condition contributing to privacy.

It has been argued that the precautionary principle, well-known in environmental ethics, might have a role in dealing with emerging information technologies as well. The principle would see to it that the burden of proof for the absence of irreversible effects of information technology on society, e.g. in terms of power relations and equality, would lie with those advocating the new technology. Precaution, in this sense, could then be used to impose restrictions at a regulatory level, in combination with or as an alternative to empowering users, thereby potentially contributing to the prevention of informational overload on the user side. Apart from general debates about the desirable and undesirable features of the precautionary principle, challenges to it lie in its translation to social effects and social sustainability, as well as in its application to consequences induced by intentional actions of agents. Whereas the occurrence of natural threats or accidents is probabilistic in nature, those who are interested in improper use of information behave strategically, requiring a different approach to risk (i.e. security as opposed to safety). In addition, proponents of precaution will need to balance it with other important principles, viz., informed consent and autonomy.

Q.1 [6895175]

The author would not disagree with each of the following statements EXCEPT:

1 ○ transparency may yield better results than precautionary principle transparency in dealing with the consequences of emerging information technologies.

2 ○ proponents of the precautionary principle must carefully balance its application with other important ethical principles to ensure comprehensive protection.

3 ○ translating the precautionary principle to social effects and sustainability is complex, particularly when dealing with intentional misuse of information.

4 ○ precautionary principle could be applied to emerging information technologies to ensure the absence of irreversible societal impacts.

[There] are future and emerging technologies that may have. . .a profound impact. Consider, for example, brain-computer interfaces. In case computers are connected directly to the brain, not only are behavioural characteristics subject to privacy considerations, but even one's thoughts run the risk of becoming public, with decisions of others being based upon them. In addition, it could become possible to change one's behaviour by means of such technology. Such developments, therefore, require further consideration of the reasons for protecting privacy. In particular, when brain processes could be influenced from the outside, autonomy would be a value to reconsider to ensure adequate protection.

Apart from evaluating information technology against current moral norms, one also needs to consider the possibility that technological changes influence the norms themselves. Technology thus does not only influence privacy by changing the accessibility of information, but also by changing the privacy norms themselves. . . . With future and emerging technologies, such influences can also be expected, and therefore, they ought to be taken into account when trying to mitigate effects.

Another fundamental question is whether, given the future (and even current) level of informational connectivity, it is feasible to protect privacy by trying to hide information from parties who may use it in undesirable ways. Gutwirth & De Hert argue that it may be more feasible to protect privacy by transparency – by requiring actors to justify decisions made about individuals, thus insisting that decisions are not based on illegitimate information. This approach comes with its own problems, as it might be hard to prove that the wrong information was used for a decision. Still, it may well happen that citizens, in turn, start data collection on those who collect data about them, e.g. governments. Such "counter(sur)veillance" may be used to gather information about the use of information, thereby improving accountability. The open-source movement may also contribute to the transparency of data processing. In this context, transparency can be seen as a pro-ethical condition contributing to privacy.

It has been argued that the precautionary principle, well-known in environmental ethics, might have a role in dealing with emerging information technologies as well. The principle would see to it that the burden of proof for the absence of irreversible effects of information technology on society, e.g. in terms of power relations and equality, would lie with those advocating the new technology. Precaution, in this sense, could then be used to impose restrictions at a regulatory level, in combination with or as an alternative to empowering users, thereby potentially contributing to the prevention of informational overload on the user side. Apart from general debates about the desirable and undesirable features of the precautionary principle, challenges to it lie in its translation to social effects and social sustainability, as well as in its application to consequences induced by intentional actions of agents. Whereas the occurrence of natural threats or accidents is probabilistic in nature, those who are interested in improper use of information behave strategically, requiring a different approach to risk (i.e. security as opposed to safety). In addition, proponents of precaution will need to balance it with other important principles, viz., informed consent and autonomy.

Q.2 [6895175]

It can be inferred from the passage that the brain-computer interface is an example of how emerging information technologies:

1 ○ can be misused to change the behavioural characteristics of human beings.

2 ○ can change behavioural characteristics to a point where it is homogenous.

3 ○ impact the morals that are widely accepted in society today.

4 ○ has a profound impact on the way in which we characterise technology.

It has been argued that the precautionary principle, well-known in environmental ethics, might have a role in dealing with emerging information technologies as well. The principle would see to it that the burden of proof for the absence of irreversible effects of information technology on society, e.g. in terms of power relations and equality, would lie with those advocating the new technology. Precaution, in this sense, could then be used to impose restrictions at a regulatory level, in combination with or as an alternative to empowering users, thereby potentially contributing to the prevention of informational overload on the user side. Apart from general debates about the desirable and undesirable features of the precautionary principle, challenges to it lie in its translation to social effects and social sustainability, as well as in its application to consequences induced by intentional actions of agents. Whereas the occurrence of natural threats or accidents is probabilistic in nature, those who are interested in improper use of information behave strategically, requiring a different approach to risk (i.e. security as opposed to safety). In addition, proponents of precaution will need to balance it with other important principles, viz., informed consent and autonomy.

Q.3 [6895175]

Each of the following is true about transparency EXCEPT that it:

1 ○ promotes ethical behaviour.

2 ○ can be a form of accountability.

3 ○ protects from illegitimate information.

4 ○ allows for greater scrutiny.

Directions for questions 1 to 4: The passage below is accompanied by four questions. Based on the passage, choose the best answer for each question.

[There] are future and emerging technologies that may have. . .a profound impact. Consider, for example, brain-computer interfaces. In case computers are connected directly to the brain, not only are behavioural characteristics subject to privacy considerations, but even one's thoughts run the risk of becoming public, with decisions of others being based upon them. In addition, it could become possible to change one's behaviour by means of such technology. Such developments, therefore, require further consideration of the reasons for protecting privacy. In particular, when brain processes could be influenced from the outside, autonomy would be a value to reconsider to ensure adequate protection.

Apart from evaluating information technology against current moral norms, one also needs to consider the possibility that technological changes influence the norms themselves. Technology thus does not only influence privacy by changing the accessibility of information, but also by changing the privacy norms themselves. . . . With future and emerging technologies, such influences can also be expected, and therefore, they ought to be taken into account when trying to mitigate effects.

Another fundamental question is whether, given the future (and even current) level of informational connectivity, it is feasible to protect privacy by trying to hide information from parties who may use it in undesirable ways. Gutwirth & De Hert argue that it may be more feasible to protect privacy by transparency – by requiring actors to justify decisions made about individuals, thus insisting that decisions are not based on illegitimate information. This approach comes with its own problems, as it might be hard to prove that the wrong information was used for a decision. Still, it may well happen that citizens, in turn, start data collection on those who collect data about them, e.g. governments. Such "counter(sur)veillance" may be used to gather information about the use of information, thereby improving accountability. The open-source movement may also contribute to the transparency of data processing. In this context, transparency can be seen as a pro-ethical condition contributing to privacy.

It has been argued that the precautionary principle, well-known in environmental ethics, might have a role in dealing with emerging information technologies as well. The principle would see to it that the burden of proof for the absence of irreversible effects of information technology on society, e.g. in terms of power relations and equality, would lie with those advocating the new technology. Precaution, in this sense, could then be used to impose restrictions at a regulatory level, in combination with or as an alternative to empowering users, thereby potentially contributing to the prevention of informational overload on the user side. Apart from general debates about the desirable and undesirable features of the precautionary principle, challenges to it lie in its translation to social effects and social sustainability, as well as in its application to consequences induced by intentional actions of agents. Whereas the occurrence of natural threats or accidents is probabilistic in nature, those who are interested in improper use of information behave strategically, requiring a different approach to risk (i.e. security as opposed to safety). In addition, proponents of precaution will need to balance it with other important principles, viz., informed consent and autonomy.

Q.4 [6895175]

Which one of the following is not an illustration of the concerns raised in the passage?

1 ○ the introduction of blockchain technology leads to greater transparency in financial transactions, prompting a reevaluation of privacy norms.

2 ○ the proliferation of smart home devices results in new regulations to protect users' privacy.

3 ○ the widespread use of facial recognition technology in public places leads to changes in societal norms about what constitutes acceptable surveillance.

4 ○ advances in brain-computer interface technology allow for more accurate diagnoses, but reduce the amount of direct interaction between patients and doctors.

Directions for questions 5 to 8: The passage below is accompanied by four questions. Based on the passage, choose the best answer for each question.

During testimony before the British House of Commons Parliamentary Committee on Science and Technology in 2004, Robert Edwards was asked whether it was possible to draw lines between eugenics and new developments in reprogenetic technologies. Here is Edwards's strange response: "[I]t depends what we mean by eugenics. Eugenics was started in the 1870s by an English geneticist who had the welfare of mankind in his mind. The work became degraded after 1930, caused by the Nazis, but also by various other things where people were found not to be behaving themselves fully correctly in relation to the way they abused their children. . . . I think we can define what we want to do without using that term, and I think we can make it clear to people what we want to do without using that term."

Edwards's generous description of Galton and his ambitions offers a remarkably peculiar rendition of eugenics' origins and rhetorical demise. He gently glosses over the racism and classism that were entwined with the founding of eugenics as a concept. . . . Galton viewed eugenics as the then-most-recent iteration of race science, whereby scientific theories and methods are used to give credence to—and justify social biases that produce—the unequal distribution of resources and opportunities that make upper-class, able-bodied whites seem inherently superior and others substandard. It is a turducken of white supremacy, ableism, and classism, served with a side dish of scientific jargon to make otherwise distasteful bigotry and intolerance seem appetising. Galton conceived of eugenics as using human intervention to accelerate natural selection, with the goal of marginalising and eventually eliminating inferior groups. Characterising his agenda as part of a broader concern for humankind's welfare is, then, rather disingenuous; most historians today certainly do not remember Galton in this way.

The point, of course, is that Robert Edwards was an apologist for eugenics as well as an enthusiast. . . . Not just an outside professional activity, eugenics also shaped how he conducted his research and clinical work. . . . This is what Edwards had in mind with his awkward response to the Parliamentary Committee's question on whether a line could be drawn. He attempted to extricate the science of eugenics from its ideological components, arguing that transparency in "say[ing] exactly what you are trying to do" could skirt the loaded nature of the term "eugenics." This could, he believed, allow researchers to shape population traits without the appearance of becoming entangled in politics and history.

But the notion of scientists controlling human reproduction and, eventually, our evolution is inherently political. There can be no disentanglement; such attempts only obfuscate what is at stake. It is a Galtonian endeavour, and Galton saw no distinction between eugenics as a clinical technique, as politics, and as ideology. Edwards strongly aligned himself with this broader vision, saying in 1999 that "[s]oon it will be a sin of parents to have a child that carries the heavy burden of genetic disease. We are entering a world where we have to consider the quality of our children."

Q.5 [6895175]

Which of the following is the main criticism that the author has towards Edwards's views on eugenics?

1 ○ Edwards argues that modern reprogenetic technologies can be pursued without invoking eugenics.

2 ○ Edwards believes that transparency in scientific goals can mitigate the negative connotations of eugenics.

3 ○ Edwards fails to acknowledge the original scientific intentions behind the concept of eugenics.

4 ○ Edwards attempts to separate the science of eugenics from its historical and ideological roots.

Edwards strongly aligned himself with this broader vision, saying in 1999 that "[s]oon it will be a sin of parents to have a child that carries the heavy burden of genetic disease. We are entering a world where we have to consider the quality of our children."

Q.6 [6895175]

The author believes that:

1 ○ Galton, unlike Edwards, embraced eugenics as both an ideological and scientific pursuit.

2 ○ Galton, unlike Edwards, believed in the power of scientific intervention in human reproduction.

3 ○ Galton, like Edwards, had little regard for the ethical implications of their work.

4 ○ Galton, like Edwards, sought to distance himself from the negative connotations of eugenics.

Edwards strongly aligned himself with this broader vision, saying in 1999 that "[s]oon it will be a sin of parents to have a child that carries the heavy burden of genetic disease. We are entering a world where we have to consider the quality of our children."

Q.7 [6895175]

What does Robert Edwards imply by the statement, "[s]oon it will be a sin of parents . . . we have to consider the quality of our children."?

1 ○ Parents will face societal pressure to use genetic technologies to prevent their children from having genetic diseases.

2 ○ The advancements in genetic technologies will allow parents to avoid having children with genetic diseases.

3 ○ Parents will be morally obligated to use genetic technologies to ensure their children are free from genetic diseases.

4 ○ Parents who do not use genetic technologies to prevent genetic diseases in their children will be viewed negatively.

Directions for questions 9 to 12: The passage below is accompanied by four questions. Based on the passage, choose the best answer for each question

Beginning in the late 1970s, the Chicago School of Antitrust claims that it made a major contribution to making antitrust policy coherent and "scientific" by introducing basic economic concepts. It advanced both the Consumer Welfare Standard (a normative economic theory to segregate legitimate economic competition goals from "value judgments") and a basic positive microeconomic theory to show how much of the conduct previously considered anti-competitive was justified on "efficiency" grounds. Its contributions had a major impact on the federal judiciary in the United States and the antitrust enforcement agencies that spread Consumer Welfare throughout the globe.

The Post-Chicago-School economists have not challenged the Consumer Welfare Standard. Instead, the Post-Chicago School has asserted that the Consumer Welfare Standard is redeemable—correctable for many of the overstatements and conservative political conclusions of the Chicago School. Proponents of the Post-Chicago School are fond of advancing the narrative that in the late 1980s and during the 1990s, major advancements occurred in industrial organisation economics. Many of the earlier Chicago School conclusions required assumptions that were not evident from the Chicago School economists and were often not typical of the factual situations under scrutiny in antitrust cases. . . .

The New Brandeisians reject several of the basic premises of the economic analysis of the Chicago School and the Post-Chicago School. Specifically, they repudiate the Consumer Welfare Standard, they wish to restore antitrust's traditional social goals, and they offer new policy objectives for antitrust. . . . Finally, they dismiss the economic method of taking markets as primary and natural and then turning to government action only when a "market failure" is present.

Perhaps the starkest contrast between the Chicago and Post-Chicago Schools and the New Brandeisians is the New Brandeisian recognition that free markets are not naturally occurring. For the New Brandeisians, like the early institutional economists and the legal realists, markets are not independent and primary. The term "free markets" is ideological, not definitional, because no market is truly free of regulation. Indeed, some markets, such as those for wholesale or retail electricity, only exist because of regulation. Nor are markets analytically "free" prior to government or other social organisations. Markets cannot exist without secure property rights, contract rules, and criminal sanctions. Nor can markets exist without social norms for cooperation. However, these are only the most fundamental of regulatory requirements. The existence of corporations, limited liability, financial markets, credit, currency, unions, work rules, and many other prerequisites of modern markets require detailed legal regimes. . . .

Thus, there are no "free markets" and "non-free markets." There are many diverse market organisations depending on how the law and governmental regulatory structures shape these markets. . . . Perhaps it is this presumption that markets function well that has been the stumbling block of the Chicago and Post-Chicago Schools. That presumption is only advisable if the market itself cannot cure the defect. New Brandeisians recognise that all markets require some government intervention or oversight to function. Chicago and Post-Chicago Schools have ideological blinders to such recognition that markets must have "rules of the game."

Q.9 [6895175]

The likely consequence of adopting the New Brandeisian perspective on antitrust policy, as opposed to the Chicago School's perspective, is:

1 ○ shift towards treating markets as naturally occurring phenomena.

2 ○ increased emphasis on consumer welfare and economic efficiency as primary goals.

3 ○ lesser freedom for the market itself in ensuring market fairness and social goals.

4 ○ subjective considerations are seen as less appropriate for economic policy decisions.

Finally, they dismiss the economic method of taking markets as primary and natural and then turning to government action only when a "market failure" is present.

Perhaps the starkest contrast between the Chicago and Post-Chicago Schools and the New Brandeisians is the New Brandeisian recognition that free markets are not naturally occurring. For the New Brandeisians, like the early institutional economists and the legal realists, markets are not independent and primary. The term "free markets" is ideological, not definitional, because no market is truly free of regulation. Indeed, some markets, such as those for wholesale or retail electricity, only exist because of regulation. Nor are markets analytically "free" prior to government or other social organisations. Markets cannot exist without secure property rights, contract rules, and criminal sanctions. Nor can markets exist without social norms for cooperation. However, these are only the most fundamental of regulatory requirements. The existence of corporations, limited liability, financial markets, credit, currency, unions, work rules, and many other prerequisites of modern markets require detailed legal regimes. . . .

Thus, there are no "free markets" and "non-free markets." There are many diverse market organisations depending on how the law and governmental regulatory structures shape these markets. . . . Perhaps it is this presumption that markets function well that has been the stumbling block of the Chicago and Post-Chicago Schools. That presumption is only advisable if the market itself cannot cure the defect. New Brandeisians recognise that all markets require some government intervention or oversight to function. Chicago and Post-Chicago Schools have ideological blinders to such recognition that markets must have "rules of the game."

Q.10 [6895175]

Which of the following best describes a commonality between the Chicago and Post-Chicago Schools, as well as a primary difference between them?

1 ○ Both schools accept the Consumer Welfare Standard; however, the Post-Chicago School favours traditional social goals.

2 ○ Both schools agree on the importance of economic efficiency; however, the Post-Chicago School emphasises an analysis that considers actual market conditions.

3 ○ Both schools advocate for minimal government intervention; however, the Post-Chicago School supports the value judgements over normative economic theory.

4 ○ Both schools maintain that markets function best with little regulation; however, the Post-Chicago School seeks to prioritise economic efficiency as a primary goal.

Directions for questions 9 to 12: The passage below is accompanied by four questions. Based on the passage, choose the best answer for each question

Beginning in the late 1970s, the Chicago School of Antitrust claims that it made a major contribution to making antitrust policy coherent and "scientific" by introducing basic economic concepts. It advanced both the Consumer Welfare Standard (a normative economic theory to segregate legitimate economic competition goals from "value judgments") and a basic positive microeconomic theory to show how much of the conduct previously considered anti-competitive was justified on "efficiency" grounds. Its contributions had a major impact on the federal judiciary in the United States and the antitrust enforcement agencies that spread Consumer Welfare throughout the globe.

The Post-Chicago-School economists have not challenged the Consumer Welfare Standard. Instead, the Post-Chicago School has asserted that the Consumer Welfare Standard is redeemable—correctable for many of the overstatements and conservative political conclusions of the Chicago School. Proponents of the Post-Chicago School are fond of advancing the narrative that in the late 1980s and during the 1990s, major advancements occurred in industrial organisation economics. Many of the earlier Chicago School conclusions required assumptions that were not evident from the Chicago School economists and were often not typical of the factual situations under scrutiny in antitrust cases. . . .

The New Brandeisians reject several of the basic premises of the economic analysis of the Chicago School and the Post-Chicago School. Specifically, they repudiate the Consumer Welfare Standard, they wish to restore antitrust's traditional social goals, and they offer new policy objectives for antitrust. . . . Finally, they dismiss the economic method of taking markets as primary and natural and then turning to government action only when a "market failure" is present.

Perhaps the starkest contrast between the Chicago and Post-Chicago Schools and the New Brandeisians is the New Brandeisian recognition that free markets are not naturally occurring. For the New Brandeisians, like the early institutional economists and the legal realists, markets are not independent and primary. The term "free markets" is ideological, not definitional, because no market is truly free of regulation. Indeed, some markets, such as those for wholesale or retail electricity, only exist because of regulation. Nor are markets analytically "free" prior to government or other social organisations. Markets cannot exist without secure property rights, contract rules, and criminal sanctions. Nor can markets exist without social norms for cooperation. However, these are only the most fundamental of regulatory requirements. The existence of corporations, limited liability, financial markets, credit, currency, unions, work rules, and many other prerequisites of modern markets require detailed legal regimes. . . .

Thus, there are no "free markets" and "non-free markets." There are many diverse market organisations depending on how the law and governmental regulatory structures shape these markets. . . . Perhaps it is this presumption that markets function well that has been the stumbling block of the Chicago and Post-Chicago Schools. That presumption is only advisable if the market itself cannot cure the defect. New Brandeisians recognise that all markets require some government intervention or oversight to function. Chicago and Post-Chicago Schools have ideological blinders to such recognition that markets must have "rules of the game."

Q.11 [6895175]

New Brandesians would most likely consider government intervention as:

1 ○ necessary to ensure markets do not remain free.

2 ○ key to creating a legal regime to control the markets.

3 ○ cental to safeguarding consumer welfare.

4 ○ integral to ensuring markets function effectively.

Beginning in the late 1970s, the Chicago School of Antitrust claims that it made a major contribution to making antitrust policy coherent and "scientific" by introducing basic economic concepts. It advanced both the Consumer Welfare Standard (a normative economic theory to segregate legitimate economic competition goals from "value judgments") and a basic positive microeconomic theory to show how much of the conduct previously considered anti-competitive was justified on "efficiency" grounds. Its contributions had a major impact on the federal judiciary in the United States and the antitrust enforcement agencies that spread Consumer Welfare throughout the globe.

The Post-Chicago-School economists have not challenged the Consumer Welfare Standard. Instead, the Post-Chicago School has asserted that the Consumer Welfare Standard is redeemable—correctable for many of the overstatements and conservative political conclusions of the Chicago School. Proponents of the Post-Chicago School are fond of advancing the narrative that in the late 1980s and during the 1990s, major advancements occurred in industrial organisation economics. Many of the earlier Chicago School conclusions required assumptions that were not evident from the Chicago School economists and were often not typical of the factual situations under scrutiny in antitrust cases. . . .

The New Brandeisians reject several of the basic premises of the economic analysis of the Chicago School and the Post-Chicago School. Specifically, they repudiate the Consumer Welfare Standard, they wish to restore antitrust's traditional social goals, and they offer new policy objectives for antitrust. . . . Finally, they dismiss the economic method of taking markets as primary and natural and then turning to government action only when a "market failure" is present.

Perhaps the starkest contrast between the Chicago and Post-Chicago Schools and the New Brandeisians is the New Brandeisian recognition that free markets are not naturally occurring. For the New Brandeisians, like the early institutional economists and the legal realists, markets are not independent and primary. The term "free markets" is ideological, not definitional, because no market is truly free of regulation. Indeed, some markets, such as those for wholesale or retail electricity, only exist because of regulation. Nor are markets analytically "free" prior to government or other social organisations. Markets cannot exist without secure property rights, contract rules, and criminal sanctions. Nor can markets exist without social norms for cooperation. However, these are only the most fundamental of regulatory requirements. The existence of corporations, limited liability, financial markets, credit, currency, unions, work rules, and many other prerequisites of modern markets require detailed legal regimes. . . .

Thus, there are no "free markets" and "non-free markets." There are many diverse market organisations depending on how the law and governmental regulatory structures shape these markets. . . . Perhaps it is this presumption that markets function well that has been the stumbling block of the Chicago and Post-Chicago Schools. That presumption is only advisable if the market itself cannot cure the defect. New Brandeisians recognise that all markets require some government intervention or oversight to function. Chicago and Post-Chicago Schools have ideological blinders to such recognition that markets must have "rules of the game."

Q.12 [6895175]

Each of the following statements, if true, strengthens the argument of New Brandesians EXCEPT:

1 ○ government regulation is an ideological solution to market woes.

2 ○ excessive centralised private power is dangerous for society.

3 ○ “excessive regulation” is an illusory and misleading category.

4 ○ how the law is coded determines how wealth is created in markets.

Directions for questions 13 to 16: The passage below is accompanied by four questions. Based on the passage, choose the best answer for each question.

In his first book, *The Human Mind* (1930), [Karl] Menninger defends psychiatry as a legitimate science. By its very nature, Menninger argues, psychiatry is concerned with criminal behaviour. According to Menninger, “As a science dealing with the queer and untoward behaviour of human beings, psychiatry is naturally much concerned with crime”. Being a psychiatrist, then, Menninger was concerned with crime and the criminal justice system. But he was critical of the ways in which psychiatrics, i.e., “the study of mental disease and its manifestations and its treatment,” was applied to issues of criminal justice. More specifically, he lamented the fact that, “instead of functioning to aid the legal profession,” psychiatrists are forced to classify people “as belonging on one side or the other of a hypothetical line of so-called ‘sanity’.” After serving on a committee appointed by the American Psychiatric Association, Menninger and his colleagues made several recommendations about how psychiatry can better serve the criminal justice system, chief among them is the following: “The elimination of the […] terms ‘insane’ and ‘insanity’, and ‘lunacy’, and the exemption of the psychiatrist from the necessity of pronouncing upon concepts of religious and legal tradition in which he has no authority or experience, such as ‘responsibility’, ‘punishment’, and ‘justice’”. Menninger and his colleagues made these recommendations in 1928. After that, Menninger’s opposition to labelling people who suffer from behavioural disorders, including criminal behaviour, as “insane” and punishing them only grew stronger.

In *The Crime of Punishment* (1968), Menninger argues that all forms of punishment are cruel, and that criminal behaviour should be treated, rather than punished, in much the same way that behavioural disorders and mental illness are treated. According to Menninger’s obituary in The New York Times, the book “contributed to penal reforms in a number of states.” A natural extension of Menninger’s view that all forms of punishment are cruel is his opposition to capital punishment. The death penalty is a frequent topic covered by prison newspapers. . . . Menninger contributed a piece on the subject. . .titled “Verdict Guilty–Now What?” Menninger writes: “Capital punishment is […] morally wrong. It has a bad effect on everyone, especially those involved in it. It gives a false sense of security to the public. It is vastly expensive. Worst of all it beclouds the entire issue of motivation in crime, which is so importantly relevant to the question of what to do for and with the criminal that will be most constructive to society as a whole. Punishing–and even killing–criminals may yield a kind of grim gratification […]. But playing God in this way has no conceivable moral or scientific justification.” In other words, Menninger argues that both consequentialist and retributivist justifications of capital punishment fail. . . . Menninger argues that from a consequentialist point of view, the death penalty cannot be justified because it does not bring about a balance of good over bad consequences for those involved in it. . . . From a retributivist point of view, Menninger argues, the death penalty cannot be justified, either, since no crime can render the criminal who committed it deserving of the death penalty.

Q.13 [6895175]

Which of the following assumptions does Menninger's argument against the use of the term 'insane' rely on?

1 ○ The term has legal implications that psychiatrists are not qualified to address.

2 ○ Psychiatry is concerned with treatment rather than aiding the legal profession.

3 ○ There is no clear definition of 'insane' that can be consistently applied.

4 ○ People labelled as 'insane' are often subjected to unjust punishments.

Directions for questions 13 to 16: The passage below is accompanied by four questions. Based on the passage, choose the best answer for each question.

In his first book, *The Human Mind* (1930), [Karl] Menninger defends psychiatry as a legitimate science. By its very nature, Menninger argues, psychiatry is concerned with criminal behaviour. According to Menninger, "As a science dealing with the queer and untoward behaviour of human beings, psychiatry is naturally much concerned with crime". Being a psychiatrist, then, Menninger was concerned with crime and the criminal justice system. But he was critical of the ways in which psychiatrics, i.e., "the study of mental disease and its manifestations and its treatment," was applied to issues of criminal justice. More specifically, he lamented the fact that, "instead of functioning to aid the legal profession," psychiatrists are forced to classify people "as belonging on one side or the other of a hypothetical line of so-called 'sanity'." After serving on a committee appointed by the American Psychiatric Association, Menninger and his colleagues made several recommendations about how psychiatry can better serve the criminal justice system, chief among them is the following: "The elimination of the […] terms 'insane' and 'insanity', and 'lunacy', and the exemption of the psychiatrist from the necessity of pronouncing upon concepts of religious and legal tradition in which he has no authority or experience, such as 'responsibility', 'punishment', and 'justice'". Menninger and his colleagues made these recommendations in 1928. After that, Menninger's opposition to labelling people who suffer from behavioural disorders, including criminal behaviour, as "insane" and punishing them only grew stronger.

In *The Crime of Punishment* (1968), Menninger argues that all forms of punishment are cruel, and that criminal behaviour should be treated, rather than punished, in much the same way that behavioural disorders and mental illness are treated. According to Menninger's obituary in The New York Times, the book "contributed to penal reforms in a number of states." A natural extension of Menninger's view that all forms of punishment are cruel is his opposition to capital punishment. The death penalty is a frequent topic covered by prison newspapers. . . . Menninger contributed a piece on the subject. . .titled "Verdict Guilty–Now What?" Menninger writes: "Capital punishment is […] morally wrong. It has a bad effect on everyone, especially those involved in it. It gives a false sense of security to the public. It is vastly expensive. Worst of all it beclouds the entire issue of motivation in crime, which is so importantly relevant to the question of what to do for and with the criminal that will be most constructive to society as a whole. Punishing–and even killing–criminals may yield a kind of grim gratification […]. But playing God in this way has no conceivable moral or scientific justification." In other words, Menninger argues that both consequentialist and retributivist justifications of capital punishment fail. . . . Menninger argues that from a consequentialist point of view, the death penalty cannot be justified because it does not bring about a balance of good over bad consequences for those involved in it. . . . From a retributivist point of view, Menninger argues, the death penalty cannot be justified, either, since no crime can render the criminal who committed it deserving of the death penalty.

Q.14 [6895175]

"But playing God in this way has no conceivable moral or scientific justification." By stating this, Menninger intends to convey that:

1 ○ Determining the fate of a criminal through capital punishment is an act that should be reserved for a divine power.

2 ○ Society's reliance on capital punishment reflects a misunderstanding of morality and the science of criminal behaviour.

3 ○ The act of deciding to end someone's life is beyond human authority and cannot be justified by ethical or empirical standards.

4 ○ The imposition of the death penalty by a society is morally reprehensible and unsupported by scientific justifications.

In *The Crime of Punishment* (1968), Menninger argues that all forms of punishment are cruel, and that criminal behaviour should be treated, rather than punished, in much the same way that behavioural disorders and mental illness are treated. According to Menninger's obituary in The New York Times, the book "contributed to penal reforms in a number of states." A natural extension of Menninger's view that all forms of punishment are cruel is his opposition to capital punishment. The death penalty is a frequent topic covered by prison newspapers. . . . Menninger contributed a piece on the subject. . .titled "Verdict Guilty–Now What?" Menninger writes: "Capital punishment is […] morally wrong. It has a bad effect on everyone, especially those involved in it. It gives a false sense of security to the public. It is vastly expensive. Worst of all it beclouds the entire issue of motivation in crime, which is so importantly relevant to the question of what to do for and with the criminal that will be most constructive to society as a whole. Punishing–and even killing–criminals may yield a kind of grim gratification […]. But playing God in this way has no conceivable moral or scientific justification." In other words, Menninger argues that both consequentialist and retributivist justifications of capital punishment fail. . . . Menninger argues that from a consequentialist point of view, the death penalty cannot be justified because it does not bring about a balance of good over bad consequences for those involved in it. . . . From a retributivist point of view, Menninger argues, the death penalty cannot be justified, either, since no crime can render the criminal who committed it deserving of the death penalty.

Q.15 [6895175]

According to Menniger, both consequentialist and retributivist justifications of capital punishment fail because:

1 ○ the former assumes that there are no bad consequences of the punishment; the latter fails to recognise that there is no crime that deserves the killing of the guilty.

2 ○ the former fails to consider the possibility that the bad can outweigh the good for those involved; the latter advocates for inherently cruel and unjustifiable punishment.

3 ○ the former is flawed due to relying on consequences as a means of punishment; the latter denies those who seek justice the retribution that is necessary for such a crime.

4 ○ the former assumes that the consequences of the punishment lead to satisfaction for those involved; the latter assumes that the punishment will act as a deterrent.

Q.17 [6895175]

There is a sentence that is missing in the paragraph below. Look at the paragraph and decide where (option 1, 2, 3, or 4) the following sentence would best fit.

Sentence: So diverse, in fact, are the meanings of silence that one sociologist has protested that silence is not a natural unit in the structure of face-to-face interaction at all.

Paragraph: If one starts to think of what silences may mean to people, he is immediately struck by a baffling variety of meanings.__1__. In many cases, silence is really the equivalent of something else. It is doubtful, therefore, whether an analysis of silences as such can be a very fruitful endeavour. __2__. Granted the fact of diversity, there is a feature common to social silences that makes them a distinct class of events. __3__. Silences have a paradoxical character, a character that provides a basis for classifying them. __4__. A consideration of this classification, in turn, will reveal limitations in one possible approach to silence, which is predominant in sociology today, while another approach, that of G. H. Mead, is a minority position, yet probably the more helpful of the two for the analysis of silence.

1 ○ Option 4

2 ○ Option 3

3 ○ Option 1

4 ○ Option 2

Q.18 [6895175]

There is a sentence that is missing in the paragraph below. Look at the paragraph and decide where (option 1, 2, 3, or 4) the following sentence would best fit.

Sentence: This duality enriches the literary form, much like Cubism enriches the visual arts, by challenging the reader to perceive and interpret multiple layers of meaning simultaneously.

Paragraph: Unless we adopt Wylie Sypher's definition of Cubism in *Rococo to Cubism in Art and Literature* (1960) and find it in any art form studying its own processes without recourse to representational reality, we may question whether "Cubist" or "cubistic" are viable terms in literature. __1__. Even if we decide that such an epithet may appropriately be applied to the alternating tones of Max Jacob's poetic works, it is essential to recognise the inherent limitations and the necessity of contextual understanding. __2__. Jacob's writings, while exhibiting the fragmented and multifaceted nature akin to Cubist visual art, also delve deeply into the realms of personal and philosophical introspection. __3__. Moreover, applying "Cubist" as a descriptor in literature encourages a re-evaluation of traditional narrative structures. Authors like Joyce, with his stream-of-consciousness technique in *Ulysses*, and Gide, with his nonlinear storytelling in *The Counterfeiters*, exemplify this shift. __4__. Their works, much like the Cubist paintings of Picasso, invite readers to engage with a text that defies straightforward interpretation, instead offering a composite view of reality from diverse perspectives.

1 ○ Option 3

2 ○ Option 1

3 ○ Option 4

4 ○ Option 2

Q.23 [6895175]

The passage given below is followed by four alternate summaries. Choose the option that best captures the essence of the passage.

In recent years, a neutral theory of community organisation has been developed by scientists such as Steve Hubbell and Graham Bell, which assumes that all individuals within broadly defined groups (e.g., trees competing for space in a tropical forest) have equal probabilities of giving birth, dying, and dispersing to new locales, irrespective of taxonomic identity. This assumption seems biologically implausible, yet the neutral theory performs surprisingly well in predicting many patterns in species-rich communities. Neutrality does not predict perpetual coexistence, but instead transient coexistence as species drift in abundance, some increasing and others decreasing due to chance. In a closed neutral community, in the long run, just one species persists. Given immigration, species richness can be maintained if external source pools harbour multiple species. Yet, at a sufficiently large scale, there can be no immigration, and maintenance of diversity in this theory ultimately requires recurrent speciation.

1 ○ The neutral theory posits equal probabilities of birth, death, and dispersal among individuals within groups, predicting temporary coexistence and long-term species richness maintained by immigration and recurrent speciation.

2 ○ Despite seeming implausible, the neutral theory predicts species patterns by assuming equal probabilities of survival and reproduction chances, leading to continual coexistence with long-term diversity reliant on immigration and speciation.

3 ○ The neutral theory, assuming equal survival and reproduction for species, effectively predicts species coexistence transiently and highlights the necessity of immigration and recurrent speciation for maintaining long-term diversity.

4 ○ The neutral theory assumes equal birth, death, and dispersal probabilities for individuals, accurately predicting transient species coexistence with no large-scale immigration and speciation to maintain diversity over time.

Q.24 [6895175]

The passage given below is followed by four alternate summaries. Choose the option that best captures the essence of the passage.

As things are, we notice that some people do consider others less than most of us, and we use words like selfish or mean to record this fact. Selfishness cannot, then, be a universal condition. This was a central problem for Hobbes, who went to great trouble to prove that, in all our acts, our real aim is always our own interest. To explain the appearance of disinterested behaviour, he focussed on enlightened self-interest, explaining that what looks like altruism is really only a shrewd insurance policy. Hobbes's trouble here was that he was not actually an immoralist. He did not actually want to get rid of the virtues. He liked an orderly society. He just wanted to stop people from using morality against their own interests, especially in futile revolts or religious wars. So he argued that virtue does serve for self-preservation, so long as the State is still functioning efficiently.

1 ○ Hobbes believed that selfishness was not universal, a view that clashed with his emphasis on self-interest as the primary motivator.

2 ○ Hobbes argued that even virtuous acts ultimately stem from self-interest, but this does not negate their value for social order.

3 ○ Hobbes's liking for an orderly society led him to promote the idea of selfishness as a means of self-preservation.

4 ○ Hobbes viewed altruism as a means to prevent selfishness, emphasising the need for an efficient State to protect the virtues.

Directions for questions 25 to 29: Answer the questions on the basis of the information given below.

Four persons- A, B, C, and D- participated in a swimming race, which had exactly four laps of 50 m each. The swimmers had to perform different strokes in each lap. Lap 1 was freestyle, Lap 2 was backstroke, Lap 3 was breaststroke and Lap 4 was butterfly stroke. The table below provides incomplete information about the time taken by each person to complete each of the 4 laps as a percentage of the total time taken to complete the race.

Person	Lap 1	Lap 2	Lap 3	Lap 4
A	-	30%	-	20%
B	25%	-	30%	-
C	25%	-	-	25%
D	25%	-	25%	-

It is further known that:
(i) The speed of A in freestyle as well as in breaststroke is 2 m/sec whereas the speed of C in breaststroke was double that of his speed in backstroke.
(ii) At the end of the Lap 3, C was ahead of D by 3 seconds whereas C took 1 second more than A to complete Lap 4.
(iii) At the end of Lap 1, B was behind D by 6 seconds. The time taken by both B and D for the backstroke lap was the same and it was 6 seconds less than the time taken by D in Lap 1.

Q.25 [6895175]
By how many seconds did the winner beat the runner up?

✖

Directions for questions 25 to 29: Answer the questions on the basis of the information given below.

Four persons- A, B, C, and D- participated in a swimming race, which had exactly four laps of 50 m each. The swimmers had to perform different strokes in each lap. Lap 1 was freestyle, Lap 2 was backstroke, Lap 3 was breaststroke and Lap 4 was butterfly stroke. The table below provides incomplete information about the time taken by each person to complete each of the 4 laps as a percentage of the total time taken to complete the race.

Person	Lap 1	Lap 2	Lap 3	Lap 4
A	-	30%	-	20%
B	25%	-	30%	-
C	25%	-	-	25%
D	25%	-	25%	-

It is further known that:
(i) The speed of A in freestyle as well as in breaststroke is 2 m/sec whereas the speed of C in breaststroke was double that of his speed in backstroke.
(ii) At the end of the Lap 3, C was ahead of D by 3 seconds whereas C took 1 second more than A to complete Lap 4.
(iii) At the end of Lap 1, B was behind D by 6 seconds. The time taken by both B and D for the backstroke lap was the same and it was 6 seconds less than the time taken by D in Lap 1.

Q.26 [6895175]
The person who came last at the end of Lap 4 was at which position at the end of Lap 2?

1 ○ First

2 ○ Second

3 ○ Third

4 ○ Fourth

✖

Directions for questions 30 to 34: Answer the questions on the basis of the information given below.

The Indian Premier League (IPL) is a T20 cricket tournament. In each match, if a team scores 'x' runs, the opposing team needs to score 'x + 1' runs to win. In a particular match between Team A and Team B, Team A batted first and set a target of 173 runs.
Team A received 18 extra runs from the following sources: 4 from no balls, 5 from wide balls, 1 from byes, and 8 from leg byes. Team A's batting lineup consisted of eleven players, positioned from 1 to 11. The bowlers, batting in positions 7 through 11, collectively scored 22 runs. Among these bowlers, there were two fast bowlers, two spinners, and one medium pacer. The fast bowlers scored the two lowest scores, while the medium pacer scored the highest runs among the bowlers. Each player scored a different number of runs, with no player's runs matching the extra runs of 1, 4, 5, or 8. Individual scores of each player doesn't include the extra runs. The opening batsmen, who played at positions 1 and 2, scored runs that were consecutive multiples of a perfect square greater than 1.
Additionally, the following information is known:
(i) No player scored more than 30 runs, and the wicketkeeper batted at position 4.
(ii) Only four players scored an odd number of runs, and at least six players scored more than 14 runs.
(iii) Only four players scored a prime number of runs. The sum of the top four scores is 100.
(iv) The batsmen at positions 3 and 5 scored the highest and second-highest runs, respectively.

Q.30 [6895175]
What is the sum of the runs made by first three batsmen?

Q.49 [6895175]

Pipe P1 fills a tank at a rate of 64 liters/minute, Pipe P2 fills at a rate of 16 liters/minute, and Pipe P3 drains at a rate of 32 liters/minute. The three pipes are kept open for one minute each, one after the other. If the capacity of the tank is 608 liters, how long (in minutes) will it take to fill the tank if P1 is kept open first, followed by P2, and then P3?
